OVERVIEW OF COMPUTER SYSTEM

INFORMATION

Information is processed data that is organized, structured, and presented in a way that makes it meaningful and useful to the recipient. It is the result of processing raw data to reveal its underlying patterns, relationships, and context. Information can be used to make decisions, solve problems, or gain knowledge.

1.1 DATA PROCESSING CYCLE/CYCLE

Data processing is the collection and manipulation of data to produce meaningful information. It involves a series of steps or operations that transform raw data into a more useful and organized form. The data processing cycle typically consists of the following stages:

Data Collection: This is the first step in the data processing cycle, where raw data is gathered from various sources. Data can be collected manually or automatically, depending on the nature of the information being collected.

Data Input: Once the data is collected, it needs to be entered into the computer system for processing. This can be done through various input devices, such as keyboards, scanners, or sensors.

Data Processing: In this stage, the computer system performs operations on the data to transform it into meaningful information. This can include tasks such as sorting, calculating, summarizing, or analyzing the data.

Data Storage: After the data is processed, it is stored in a storage device, such as a hard disk drive or a solid-state drive, for future use. This allows the information to be retrieved and accessed when needed.

Data Output: The final step in the data processing cycle is the presentation of the processed information to the user. This can be in the form of reports, graphs, charts, or other visual representations.

Data Feedback: In some cases, the output of the data processing cycle may be used to provide feedback to the input stage, allowing for adjustments or improvements to be made to the data collection or processing methods.

1.2 COMPUTER DEVICES

Def. Physical components of a computer system.

Types of Computer Devices:
- Input devices
- Output devices
- Storage devices
- Processing devices
- Communication devices

Input devices are hardware components that allow users to enter data and instructions into a computer system. Some common input devices include:
- Keyboard
- Mouse
- Touchscreen
- Scanner
- Microphone
- Webcam
- Joystick
- Barcode reader

Output devices are hardware components that display or produce the results of computer processing. Some common output devices include:
- Monitor
- Printer
- Speakers
- Projector
- Headphones
- Plotter

Storage devices are hardware components that store data and instructions for later use. Some common storage devices include:
- Hard disk drive (HDD)
- Solid-state drive (SSD)
- USB flash drive
- Optical disc (CD, DVD, Blu-ray)
- Memory card

Processing devices are hardware components that perform the actual computing tasks. The most important processing device is the central processing unit (CPU), which is responsible for executing instructions and performing calculations.

Communication devices are hardware components that allow computers to communicate with each other and with other devices. Some common communication devices include:
- Network interface card (NIC)
- Modem
- Router
- Wireless access point

1.3 COMPUTER SYSTEM

Def. A computer system is a combination of hardware and software components that work together to perform various tasks and operations. It is a complex system that includes the physical components of the computer, as well as the programs and data that run on it.

Components of a Computer System:
- Hardware
- Software
- Data
- People

Hardware refers to the physical components of a computer system, such as the central processing unit (CPU), memory, storage devices, input devices, and output devices. These components work together to process and store data.

Software is the set of instructions that tells the hardware what to do. It includes operating systems, application programs, and utility programs. Software is responsible for managing the hardware and providing the user interface.

Data is the information that is processed by the computer system. It can be in the form of text, numbers, images, audio, or video. Data is stored on storage devices and is accessed by the software.

People are the users of the computer system. They interact with the system through input devices and receive output from the system. People are responsible for creating, maintaining, and using the computer system.

Def. The "brain" of the computer system, responsible for carrying out the instructions of computer programs by performing basic arithmetic, logical, control, and input/output operations.

Components of a CPU:
- Control Unit (CU)
- Arithmetic Logic Unit (ALU)
- Registers
- Cache memory

Control Unit (CU): The CU is responsible for fetching instructions from memory, decoding them, and executing them. It coordinates the activities of all other components of the CPU.

Arithmetic Logic Unit (ALU): The ALU performs arithmetic operations, such as addition, subtraction, multiplication, and division, as well as logical operations, such as comparisons and bitwise operations.

Registers: Registers are small, high-speed memory locations within the CPU that store data and instructions that are currently being processed.

Cache memory: Cache memory is a small, fast memory that stores frequently accessed data and instructions, reducing the need to access slower main memory.

Types of CPUs:
- Single-core CPU
- Multi-core CPU
- Embedded CPU
- Mobile CPU

Single-core CPU: A single-core CPU has one processing unit that can execute one instruction at a time.

Multi-core CPU: A multi-core CPU has multiple processing units that can execute multiple instructions simultaneously, improving overall performance.

Embedded CPU: Embedded CPUs are designed for specific applications, such as in-car systems, industrial control systems, or consumer electronics.

Mobile CPU: Mobile CPUs are designed for low-power consumption and are used in smartphones, tablets, and other mobile devices.

Memory: Memory is a hardware component that stores data and instructions for the computer to access and process. It is an essential part of a computer system, as it allows the CPU to quickly retrieve and manipulate information.

Types of Memory:
- Primary memory
- Secondary memory
- Cache memory
- Virtual memory

Primary memory is the main memory of the computer, also known as random-access memory (RAM). It is volatile, meaning that its contents are lost when the power is turned off. Primary memory is used to store the operating system, application programs, and data that are currently being used.

Secondary memory is non-volatile storage that retains its contents even when the power is turned off. Examples include hard disk drives, solid-state drives, and optical discs. Secondary memory is used to store data and programs that are not currently being used.

Cache memory is a small, high-speed memory that stores frequently accessed data and instructions, reducing the need to access slower main memory.

Virtual memory is a technique that allows the computer to use a portion of the hard disk as an extension of the RAM, effectively increasing the amount of memory available to the system.

Motherboard: The motherboard is the main circuit board of the computer system. It connects all the components of the computer, including the CPU, memory, storage devices, and input/output devices.

Power supply: The power supply unit (PSU) converts the electrical power from the wall outlet into the appropriate voltages and currents required by the computer components.

Cooling system: The cooling system, which may include fans, heat sinks, or liquid cooling, is responsible for dissipating the heat generated by the CPU and other components to prevent overheating.

Expansion slots: Expansion slots allow the user to add additional hardware components, such as graphics cards, sound cards, or network cards, to the computer system.

Ports: Ports are interfaces that allow the computer to connect to external devices, such as keyboards, mice, monitors, printers, and storage devices.

Chassis: The chassis is the physical enclosure that houses the computer components and provides protection and support.

Operating system: The operating system is the software that manages the hardware and provides a user interface for the computer system.

Application programs: Application programs are software that perform specific tasks, such as word processing, spreadsheet, or web browsing.

Utility programs: Utility programs are software that perform maintenance and optimization tasks, such as disk cleanup, defragmentation, and virus scanning.

1.4 CLASSIFICATION OF COMPUTER & TYPES OF CAR

Def. Computers can be classified based on their size, processing power, and intended use. They can be broadly categorized into the following types:

Supercomputers: These are the most powerful and expensive computers, designed for complex scientific and engineering calculations, such as weather forecasting, nuclear simulations, and cryptography.

Mainframe computers: These are large-scale computers used by organizations for critical applications, such as banking, airline reservations, and government operations.

Minicomputers: These are smaller than mainframes but still powerful, used for tasks like scientific research, engineering, and business applications.

Microcomputers: These are the most common type of computers, including personal computers (PCs), laptops, and tablets, used for general-purpose computing.

Embedded computers: These are specialized computers built into other devices, such as cars, appliances, and industrial equipment, to control their functions.

Types of Cars:

Sedan	Coupe
Hatchback	Convertible
SUV	Minivan
Pickup Truck	Sports Car

Def. Computer software refers to the set of instructions, data, or programs used to operate computers and execute specific tasks. It is the intangible part of a computer system, as opposed to the physical hardware components.

Types of Software:
- System software
- Application software
- Utility software
- Programming software

System software is the foundational software that manages and controls the computer hardware and provides a platform for other software to run. Examples include operating systems, device drivers, and firmware.

Application software is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing. Examples include Microsoft Office, Google Chrome, and Adobe Photoshop.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning. Examples include antivirus software and file compression tools.

Programming software is used to create, test, and maintain other software. It includes tools like compilers, debuggers, and integrated development environments (IDEs).

Software Licensing:
- Proprietary software
- Open-source software
- Freeware
- Shareware

Proprietary software is owned by a company and its use is restricted by a license agreement. Users typically cannot modify or distribute the software.

Open-source software is made available to the public with the source code, allowing users to modify and distribute the software freely.

Freeware is software that is available for free, but the source code is not provided.

Shareware is software that is distributed for free, but users are encouraged to pay a fee to unlock additional features or support the developer.

1.5 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.5.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.5.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software
- Web browsers
- Email clients
- Media players
- Graphics software
- Accounting software
- Enterprise software

Word processing software is used to create, edit, and format text-based documents, such as letters, reports, and essays. Examples include Microsoft Word and Google Docs.

Spreadsheet software is used to perform calculations, analyze data, and create charts and graphs. Examples include Microsoft Excel and Google Sheets.

Presentation software is used to create and deliver slideshows for presentations. Examples include Microsoft PowerPoint and Google Slides.

Database software is used to store, organize, and manage large amounts of data. Examples include Microsoft Access and MySQL.

Web browsers are used to access and navigate the internet. Examples include Google Chrome, Mozilla Firefox, and Microsoft Edge.

Email clients are used to send, receive, and manage email messages. Examples include Microsoft Outlook and Gmail.

Media players are used to play audio and video files. Examples include VLC Media Player and Windows Media Player.

Graphics software is used to create, edit, and manipulate images and graphics. Examples include Adobe Photoshop and GIMP.

Accounting software is used to manage financial transactions and records. Examples include QuickBooks and Xero.

Enterprise software is used to manage and integrate various business processes and functions. Examples include SAP and Oracle.

Def. There are three main types of software.

1.5.3 SOFTWARE

Def. Software refers to the set of instructions, data, or programs used to operate computers and execute specific tasks. It is the intangible part of a computer system, as opposed to the physical hardware components.

Types of Software:
- System software
- Application software
- Utility software
- Programming software

System software is the foundational software that manages and controls the computer hardware and provides a platform for other software to run. Examples include operating systems, device drivers, and firmware.

Application software is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing. Examples include Microsoft Office, Google Chrome, and Adobe Photoshop.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning. Examples include antivirus software and file compression tools.

Programming software is used to create, test, and maintain other software. It includes tools like compilers, debuggers, and integrated development environments (IDEs).

Software Licensing:
- Proprietary software
- Open-source software
- Freeware
- Shareware

Proprietary software is owned by a company and its use is restricted by a license agreement. Users typically cannot modify or distribute the software.

Open-source software is made available to the public with the source code, allowing users to modify and distribute the software freely.

Freeware is software that is available for free, but the source code is not provided.

Shareware is software that is distributed for free, but users are encouraged to pay a fee to unlock additional features or support the developer.

1.6 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.6.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.6.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software
- Web browsers
- Email clients
- Media players
- Graphics software
- Accounting software
- Enterprise software

Word processing software is used to create, edit, and format text-based documents, such as letters, reports, and essays. Examples include Microsoft Word and Google Docs.

Spreadsheet software is used to perform calculations, analyze data, and create charts and graphs. Examples include Microsoft Excel and Google Sheets.

Presentation software is used to create and deliver slideshows for presentations. Examples include Microsoft PowerPoint and Google Slides.

Database software is used to store, organize, and manage large amounts of data. Examples include Microsoft Access and MySQL.

Web browsers are used to access and navigate the internet. Examples include Google Chrome, Mozilla Firefox, and Microsoft Edge.

Email clients are used to send, receive, and manage email messages. Examples include Microsoft Outlook and Gmail.

Media players are used to play audio and video files. Examples include VLC Media Player and Windows Media Player.

Graphics software is used to create, edit, and manipulate images and graphics. Examples include Adobe Photoshop and GIMP.

Accounting software is used to manage financial transactions and records. Examples include QuickBooks and Xero.

Enterprise software is used to manage and integrate various business processes and functions. Examples include SAP and Oracle.

1.7 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.7.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.7.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software
- Web browsers
- Email clients
- Media players
- Graphics software
- Accounting software
- Enterprise software

Word processing software is used to create, edit, and format text-based documents, such as letters, reports, and essays. Examples include Microsoft Word and Google Docs.

Spreadsheet software is used to perform calculations, analyze data, and create charts and graphs. Examples include Microsoft Excel and Google Sheets.

Presentation software is used to create and deliver slideshows for presentations. Examples include Microsoft PowerPoint and Google Slides.

Database software is used to store, organize, and manage large amounts of data. Examples include Microsoft Access and MySQL.

Web browsers are used to access and navigate the internet. Examples include Google Chrome, Mozilla Firefox, and Microsoft Edge.

Email clients are used to send, receive, and manage email messages. Examples include Microsoft Outlook and Gmail.

Media players are used to play audio and video files. Examples include VLC Media Player and Windows Media Player.

Graphics software is used to create, edit, and manipulate images and graphics. Examples include Adobe Photoshop and GIMP.

Accounting software is used to manage financial transactions and records. Examples include QuickBooks and Xero.

Enterprise software is used to manage and integrate various business processes and functions. Examples include SAP and Oracle.

1.8 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.8.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.8.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software
- Web browsers
- Email clients
- Media players
- Graphics software
- Accounting software
- Enterprise software

Word processing software is used to create, edit, and format text-based documents, such as letters, reports, and essays. Examples include Microsoft Word and Google Docs.

Spreadsheet software is used to perform calculations, analyze data, and create charts and graphs. Examples include Microsoft Excel and Google Sheets.

Presentation software is used to create and deliver slideshows for presentations. Examples include Microsoft PowerPoint and Google Slides.

Database software is used to store, organize, and manage large amounts of data. Examples include Microsoft Access and MySQL.

Web browsers are used to access and navigate the internet. Examples include Google Chrome, Mozilla Firefox, and Microsoft Edge.

Email clients are used to send, receive, and manage email messages. Examples include Microsoft Outlook and Gmail.

Media players are used to play audio and video files. Examples include VLC Media Player and Windows Media Player.

Graphics software is used to create, edit, and manipulate images and graphics. Examples include Adobe Photoshop and GIMP.

Accounting software is used to manage financial transactions and records. Examples include QuickBooks and Xero.

Enterprise software is used to manage and integrate various business processes and functions. Examples include SAP and Oracle.

1.9 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.9.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.9.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software
- Web browsers
- Email clients
- Media players
- Graphics software
- Accounting software
- Enterprise software

Word processing software is used to create, edit, and format text-based documents, such as letters, reports, and essays. Examples include Microsoft Word and Google Docs.

Spreadsheet software is used to perform calculations, analyze data, and create charts and graphs. Examples include Microsoft Excel and Google Sheets.

Presentation software is used to create and deliver slideshows for presentations. Examples include Microsoft PowerPoint and Google Slides.

Database software is used to store, organize, and manage large amounts of data. Examples include Microsoft Access and MySQL.

Web browsers are used to access and navigate the internet. Examples include Google Chrome, Mozilla Firefox, and Microsoft Edge.

Email clients are used to send, receive, and manage email messages. Examples include Microsoft Outlook and Gmail.

Media players are used to play audio and video files. Examples include VLC Media Player and Windows Media Player.

Graphics software is used to create, edit, and manipulate images and graphics. Examples include Adobe Photoshop and GIMP.

Accounting software is used to manage financial transactions and records. Examples include QuickBooks and Xero.

Enterprise software is used to manage and integrate various business processes and functions. Examples include SAP and Oracle.

1.10 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.10.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.10.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software
- Web browsers
- Email clients
- Media players
- Graphics software
- Accounting software
- Enterprise software

Word processing software is used to create, edit, and format text-based documents, such as letters, reports, and essays. Examples include Microsoft Word and Google Docs.

Spreadsheet software is used to perform calculations, analyze data, and create charts and graphs. Examples include Microsoft Excel and Google Sheets.

Presentation software is used to create and deliver slideshows for presentations. Examples include Microsoft PowerPoint and Google Slides.

Database software is used to store, organize, and manage large amounts of data. Examples include Microsoft Access and MySQL.

Web browsers are used to access and navigate the internet. Examples include Google Chrome, Mozilla Firefox, and Microsoft Edge.

Email clients are used to send, receive, and manage email messages. Examples include Microsoft Outlook and Gmail.

Media players are used to play audio and video files. Examples include VLC Media Player and Windows Media Player.

Graphics software is used to create, edit, and manipulate images and graphics. Examples include Adobe Photoshop and GIMP.

Accounting software is used to manage financial transactions and records. Examples include QuickBooks and Xero.

Enterprise software is used to manage and integrate various business processes and functions. Examples include SAP and Oracle.

1.11 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.11.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.11.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software
- Web browsers
- Email clients
- Media players
- Graphics software
- Accounting software
- Enterprise software

Word processing software is used to create, edit, and format text-based documents, such as letters, reports, and essays. Examples include Microsoft Word and Google Docs.

Spreadsheet software is used to perform calculations, analyze data, and create charts and graphs. Examples include Microsoft Excel and Google Sheets.

Presentation software is used to create and deliver slideshows for presentations. Examples include Microsoft PowerPoint and Google Slides.

Database software is used to store, organize, and manage large amounts of data. Examples include Microsoft Access and MySQL.

Web browsers are used to access and navigate the internet. Examples include Google Chrome, Mozilla Firefox, and Microsoft Edge.

Email clients are used to send, receive, and manage email messages. Examples include Microsoft Outlook and Gmail.

Media players are used to play audio and video files. Examples include VLC Media Player and Windows Media Player.

Graphics software is used to create, edit, and manipulate images and graphics. Examples include Adobe Photoshop and GIMP.

Accounting software is used to manage financial transactions and records. Examples include QuickBooks and Xero.

Enterprise software is used to manage and integrate various business processes and functions. Examples include SAP and Oracle.

1.12 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.12.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.12.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software
- Web browsers
- Email clients
- Media players
- Graphics software
- Accounting software
- Enterprise software

Word processing software is used to create, edit, and format text-based documents, such as letters, reports, and essays. Examples include Microsoft Word and Google Docs.

Spreadsheet software is used to perform calculations, analyze data, and create charts and graphs. Examples include Microsoft Excel and Google Sheets.

Presentation software is used to create and deliver slideshows for presentations. Examples include Microsoft PowerPoint and Google Slides.

Database software is used to store, organize, and manage large amounts of data. Examples include Microsoft Access and MySQL.

Web browsers are used to access and navigate the internet. Examples include Google Chrome, Mozilla Firefox, and Microsoft Edge.

Email clients are used to send, receive, and manage email messages. Examples include Microsoft Outlook and Gmail.

Media players are used to play audio and video files. Examples include VLC Media Player and Windows Media Player.

Graphics software is used to create, edit, and manipulate images and graphics. Examples include Adobe Photoshop and GIMP.

Accounting software is used to manage financial transactions and records. Examples include QuickBooks and Xero.

Enterprise software is used to manage and integrate various business processes and functions. Examples include SAP and Oracle.

1.13 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.13.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.13.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software
- Web browsers
- Email clients
- Media players
- Graphics software
- Accounting software
- Enterprise software

Word processing software is used to create, edit, and format text-based documents, such as letters, reports, and essays. Examples include Microsoft Word and Google Docs.

Spreadsheet software is used to perform calculations, analyze data, and create charts and graphs. Examples include Microsoft Excel and Google Sheets.

Presentation software is used to create and deliver slideshows for presentations. Examples include Microsoft PowerPoint and Google Slides.

Database software is used to store, organize, and manage large amounts of data. Examples include Microsoft Access and MySQL.

Web browsers are used to access and navigate the internet. Examples include Google Chrome, Mozilla Firefox, and Microsoft Edge.

Email clients are used to send, receive, and manage email messages. Examples include Microsoft Outlook and Gmail.

Media players are used to play audio and video files. Examples include VLC Media Player and Windows Media Player.

Graphics software is used to create, edit, and manipulate images and graphics. Examples include Adobe Photoshop and GIMP.

Accounting software is used to manage financial transactions and records. Examples include QuickBooks and Xero.

Enterprise software is used to manage and integrate various business processes and functions. Examples include SAP and Oracle.

1.14 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.14.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.14.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software
- Web browsers
- Email clients
- Media players
- Graphics software
- Accounting software
- Enterprise software

Word processing software is used to create, edit, and format text-based documents, such as letters, reports, and essays. Examples include Microsoft Word and Google Docs.

Spreadsheet software is used to perform calculations, analyze data, and create charts and graphs. Examples include Microsoft Excel and Google Sheets.

Presentation software is used to create and deliver slideshows for presentations. Examples include Microsoft PowerPoint and Google Slides.

Database software is used to store, organize, and manage large amounts of data. Examples include Microsoft Access and MySQL.

Web browsers are used to access and navigate the internet. Examples include Google Chrome, Mozilla Firefox, and Microsoft Edge.

Email clients are used to send, receive, and manage email messages. Examples include Microsoft Outlook and Gmail.

Media players are used to play audio and video files. Examples include VLC Media Player and Windows Media Player.

Graphics software is used to create, edit, and manipulate images and graphics. Examples include Adobe Photoshop and GIMP.

Accounting software is used to manage financial transactions and records. Examples include QuickBooks and Xero.

Enterprise software is used to manage and integrate various business processes and functions. Examples include SAP and Oracle.

1.15 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.15.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.15.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software
- Web browsers
- Email clients
- Media players
- Graphics software
- Accounting software
- Enterprise software

Word processing software is used to create, edit, and format text-based documents, such as letters, reports, and essays. Examples include Microsoft Word and Google Docs.

Spreadsheet software is used to perform calculations, analyze data, and create charts and graphs. Examples include Microsoft Excel and Google Sheets.

Presentation software is used to create and deliver slideshows for presentations. Examples include Microsoft PowerPoint and Google Slides.

Database software is used to store, organize, and manage large amounts of data. Examples include Microsoft Access and MySQL.

Web browsers are used to access and navigate the internet. Examples include Google Chrome, Mozilla Firefox, and Microsoft Edge.

Email clients are used to send, receive, and manage email messages. Examples include Microsoft Outlook and Gmail.

Media players are used to play audio and video files. Examples include VLC Media Player and Windows Media Player.

Graphics software is used to create, edit, and manipulate images and graphics. Examples include Adobe Photoshop and GIMP.

Accounting software is used to manage financial transactions and records. Examples include QuickBooks and Xero.

Enterprise software is used to manage and integrate various business processes and functions. Examples include SAP and Oracle.

1.16 TYPES OF COMPUTER SOFTWARE

Def. There are four main types of computer software.

1.16.1 SYSTEM SOFTWARE

Def. System software is a type of computer software that manages and controls the computer hardware and provides a platform for other software to run. It acts as an interface between the hardware and the user-level software, such as application programs.

Types of System Software:
- Operating system
- Device drivers
- Firmware
- Utility software

Operating system is the most important system software that manages the computer hardware and provides a user interface. Examples include Windows, macOS, Linux, and Android.

Device drivers are software that allow the operating system to communicate with and control hardware devices, such as printers, scanners, and graphics cards.

Firmware is software that is embedded in hardware devices, such as routers, modems, and smartphones, to control their basic functions.

Utility software is designed to perform maintenance and optimization tasks for the computer system, such as disk cleanup, defragmentation, and virus scanning.

1.16.2 APPLICATION SOFTWARE

Def. Application software is a type of computer software that is designed to perform specific tasks for the user, such as word processing, spreadsheet, or web browsing.

Types of Application Software:
- Word processing software
- Spreadsheet software
- Presentation software
- Database software

Q.4) Write a note on speakers.
Answer
Introduction
Speakers are audio output devices that are attached to the sound card on motherboard. Speakers produce enhance sound. The size of sound. Speakers are available in different shapes and sizes as shown in Fig. 1.30.

Fig. 1.30 Speakers

KEY POINTS

- A computer is a device, which takes instructions and data in the form of input, performs computations according to the given instructions and provides results as a result of it.
- Computers are classified into four categories namely supercomputer, mainframe, minicomputer and microcomputer.
- Microcomputers are the smallest and the least expensive computers. Minicomputers are bigger and more powerful computers.
- Mainframes are used in large companies to store huge amount and hold vital data and are known as enterprise computers.
- Supercomputers are a collection of programs to make the most of computer power, efficient and effective.
- Software software is a set of programs designed to perform a particular task.
- Firmware is intermediate form between hardware and software which consists of software embedded in electronic devices during their manufacture.
- Software can be divided into two broad categories. They divided data and instructions from the user and convert them into machine readable form. Second category is the output software.
- Output devices consist of peripheral devices that transfer information from the main memory to the outside world in human readable form.
- Hardware is the physical component or parts of a computer device such as printer.
- Software is data or instructions that tell the computer what to do.

EXERCISE

A) Choose the correct alternative from the following questions.

i. Which of the following is not suitable for playing games.
a. Mainframe b. Minicomputer c. Microcomputer d. Supercomputer
ii. Which of the following is a microcomputer?
a. Set of super computer b. Any personal computer c. Mainframe computer
d. Billions of calculations 2. Above million instructions
iii. Which of the following are MS Word ?
a. System software b. Application software
c. Utility software d. Language processor

iv. _____ device is most suitable for playing games.
a. Mouse b. Keyboard c. Joystick d. Light pen
v. Which is the following is not a pointer device?
a. Set of super printer b. Any personal c. Mainframe d. Plotter
vi. _____ software controls the operation of a hardware device.
a. Application b. Utility c. Device driver d. Language
vii. Which of the following devices is used to print large size hardcopy?
a. Monitor b. Printer c. Plotter d. Chain printer
viii. Which of the following devices converts spoken words into electronic signals?
a. Microphone b. Keyboard c. Mouse d. Digital Camera
ix. _____ software converts computer programs into machine language.
a. Language processor b. Utility c. Application d. Device driver
x. Which of the following is productivity software?
a. Windows 7 b. Linux c. Utility software d. Device driver

Answer

i.	ii.	iii.	iv.	v.	vi.	vii.	viii.	ix.	x.
C	C	C	C	B	B	C	C	A	A

B) Give short answers for the following questions.

i. Give important characteristics of computers.
Answer
The following are some of the main characteristics of computer.
1. Speed
Speed is one of the main characteristics of a computer. A computer can perform billions of calculations in a second. The speed of a computer is measured in Mega Hertz (MHz) or Giga Hertz (GHz).
2. Accuracy
Accuracy can perform calculations and process data with the same degree of accuracy. Results can be wrong only if incorrect data is fed to the computer or it may be the cause of an error.
3. Storing Data
Storage capacity is another key characteristic of a computer. It computer can store large amount of data and information in its memory. Data can be stored in the form of kilobytes (KB), megabytes (MB), gigabytes (GB), terabytes (TB), and petabytes (PB).
4. Consistency
Computers have the ability to communicate, but of course there needs some sort of connection between them. Computers can be connected to each other through a network. Once they are connected software and data can be shared with each other. Computers connected by a network are referred to as networks.
5. Multitasking
Multitasking is also a computer characteristic. Computers can perform several tasks at a time. For example you can listen to songs downloaded from the internet and at the same time.
6. Intelligence
Computers do not have any intelligence of their own. They follow a set of instructions fed into them.

by manufacturer. The user knows what to do and when to perform a specific task.
ii. Compare microcomputer with mainframe computer.
Answer

Comparison of microcomputer with mainframe computer:	
Microcomputer	Mainframe computer
A microcomputer is a computer whose CPU is a microprocessor. A microprocessor is a single integrated circuit chip that contains many integrated circuit chips and is the computer's central processing unit. Microcomputer systems designed for performing basic computing tasks for individuals or small business applications sharing same file.	Mainframe computers are also used to handle huge volumes of data and information. These computers are physically large and require a room or even several rooms. They are very powerful and can process and store very large storage capacity and memory as compared to microcomputers. They are also very fast processor and work with more than one processor. Mainframe computers are also called as enterprise computers. They are multiuser, multiprocessor computers that can support hundreds or even thousands of users. Mainframe computing systems are needed in business and scientific fields.

iii. Give two application areas of supercomputers.
Answer
Applications of supercomputers
1. Supercomputers are also used in nuclear research and weather forecasting, which requires huge amount of calculations and data processing.
2. In Pakistan, supercomputers are used in many organizations like Atomic Energy Research Centers.
3. Some the organizations of Pakistan where Supercomputers are used.
Answer
Some of the names of the organizations of Pakistan where Supercomputers are used.
1. Pakistan Atomic Energy Commission
2. Karachi Nuclear Laboratories
3. Space Research Laboratories
4. Have taxicab symbol works in a shopping mall?

iv. Explain system. Variables contain information about the product the name of the product, company, manufacturing date, expiry date, etc. This information is provided to the computer for further processing. Such information is called system variables.
v. Differentiate between computer hardware and software.
Answer

Difference between computer hardware and software.		
	Computer Hardware	Computer Software
Definition of	Hardware is the term used to refer to the physical parts of a computer such as the keyboard, mouse, CD-ROM, Pen drive, Monitor, etc.	Software is a set of computer instructions that are used to interact with the computer. It is also known as computer program.
Examples of	Mouse, CPU, Keyboard, Mouse, CD-ROM, Pen drive, Monitor, etc.	Microsoft Word, Microsoft Excel, Microsoft Access, etc.
Types of	Input devices, Output devices, Storage devices.	System software, Programming software, Application software.

vi. Differentiate between system software and application software.
Answer

Difference between system software and application software	
System software	Application software
System software is a collection of programs that control and coordinate the operations of computer hardware. System software is a collection of operating programs required to control computer hardware and to run application software.	Application software is a collection of programs designed to perform a specific task.

vii. Define licensed software.
Answer
Licensed software
Licensed software is a legal agreement that specifies the terms of use for a computer program. It defines the rights of the software developer and the user. When a person purchases software, he is purchasing a license to use the software. The terms of the license vary depending on the type of software.
viii. Differentiate between shareware and freeware.
Answer

Difference between shareware and freeware	
Shareware	Freeware
Shareware is usually a free trial version of a software program. It is distributed free of charge. Shareware is a free version and the user is allowed to use it for a limited period of time. After the trial period is over, the user is required to buy the software if he wants to continue using it.	Freeware is available for free of cost. It is distributed free of charge. The author of freeware software may or may not charge for updates. Freeware is free of use. For example, it may be used in schools, offices, academic, and also for non-profit use.

ix. Briefly describe magnetic stripe card.
Answer
Magnetic Stripe Card
Magnetic stripe card has a magnetic stripe, which is used to store data in the form of tiny magnetized particles. Information stored on magnetic stripe can be read by swiping the card past a magnetic reading head. Examples of these cards include credit cards, ATM cards, driving licenses, membership cards, and security cards.
x. Give any five advantages of using LCD monitor over CRT monitor?
Answer
The following are the advantages of using LCD monitor over CRT monitor
i) LCD monitors are more lightweight and portable as compared to CRT monitors.
ii) An LCD monitor is significantly thinner and lighter than a CRT monitor, typically weighing half as much. This makes them more portable and easier to move around, as well as ideal for those with limited desktop space.
iii) LCD monitors consume significantly less power than CRT monitors, and can reduce the electricity bill, and maintain from horizontal to vertical mode.
iv) LCD monitors are flicker free, which means that they produce a flicker free CRT checks do. In addition, LCD monitors do a better job of displaying text compared with CRT displays.
v) LCD monitor does not flicker the image, whereas, CRT monitor does.
xi. Why LED monitors are better choice for LCDs? Give three reasons to support your answer.
Answer
LED monitors are better choice for LCDs, the reasons are
1. LED monitors are more energy efficient, and they produce much better resolutions
2. LEDs in the screen themselves and consume less power as compare to LCDs.
3. Lifespan of LED monitors is longer than LCD monitors.
xii. Why LED monitors are better choice for LCDs?
Answer
LED monitors are better choice because discovery problems are rocky, have limited lifespan, and are not energy efficient as compared to LED monitors.
xiii. What are the advantages of using laser printer over dot matrix printer?
Answer
A laser printer is much faster and still cheaper to operate than an inkjet, but cannot create certain colors and is not as versatile as an inkjet. Laser printers are fast, quiet, and can print high-quality text and graphics printer is lower, noisier and lower print quality but it does have the ability to print on multipart forms and carbon copies. It can also create carbon copies due to the fact that it prints with impact.
xiv. Name some uses of plotters.
Answer
Uses of plotters
Plotters are used for a variety of applications, which include
- Drawing graphs
- Making signs
- Computer-engineering drawings/computer-aided designs

C) Write True/False statements in the following questions.

i. Describe the types of system software.
Answer
Types of System Software
Some types of system software are

- Operating system
- Device Drivers
- Utility Software
- Language Processors/Translators

1. Operating System
An operating system manages the hardware and software resources of a computer system, such as CPU, storage devices and all the hardware devices. Some commonly used operating systems are Windows, Linux, Mac OS and Android.
2. Device Drivers
Operating system performs the following tasks
- Provides system resources
- Manages files and provides a proper file and folder system
- Loads and executes application software
- Controls the operation of all the input/output devices
- Provides security
- Controls network operations
- Manages system errors

3. Device Drivers
Device drivers are system software that control the operation of hardware devices. When we attach a device such as a printer to a computer, we must install a device driver. Otherwise, the device will not work without a device driver. We have to find the kind of device is in our computer before using a device driver. For example, if we have a printer, we must know the exact model of the printer. The main drivers are Printer Driver, Video Driver, Sound Driver, Network Driver, Storage Driver, Input Device Driver, Output Device Driver, etc.
4. Utility Software
Utility software consists of many unrelated miscellaneous facilities to carry out tasks, which are beyond the capabilities of the operating system. A few important utilities are file compression, anti-virus software, file compression utilities, antivirus utility, file manager, network utilities and utilities to configure peripheral devices.
5. Language Processors/Translators
Computers can only understand machine language which consists of binary digits 0's. Therefore, any program written in assembly language or high-level language must be translated to machine language. Language processors or translators are system programs used to translate computer programs into machine language.
Types of Language Processors
The three types of language processors are as follows.
- Assembler
- Compiler
- Interpreter

a. Assembler
Assembler is software that translates assembly language program into machine language. Assembler checks for errors of common grammatical rules/statements which must be followed when writing assembly language statements by the computer. Errors are reported to the user and assembly process stops.
b. Compiler
Compiler is software that translates a program written in a high-level language into machine language. It converts the entire program into machine language before execution of the program.
c. Interpreter
Interpreter is software that translates high-level language into machine language for a hardware

use instruction at a time and executes it immediately before the translation of the next instruction.
ii. Which scanners are used? Describe their working.
Answer
Uses of Scanners
Flatbed and sheet scanners are widely used to get drawings, diagrams and photographs into computer systems. Flatbed scanners are also known as desktop scanners and can be described in the following.
Types of Scanners
There are three types of scanners like
- Flatbed Scanner
- Portable Scanner
- Barcode Reader

1. Flatbed Scanner
To start an image, the hand-held scanner is dragged over the image to be scanned. The hand-held scanner should be moved slowly and steadily. If the scanner is moved too quickly, it may produce distorted image.

Fig. 1.34 Flatbed Scanner

Uses of Hand-held Scanners
Hand-held scanners are useful for scanning articles from magazines, newspapers, etc.
Flatbed scanners are shown in Fig. 1.34.
2. Portable Scanner
Portable scanners work like the image to be scanned is placed face down on the glass and a scan head is moved over it to include light. The camera moves across glass pane reading the entire area. A flatbed scanner is shown in Fig. 1.35.

Fig. 1.35 Flatbed Scanner

3. Barcode Reader
Barcode readers are a type of scanning device. Barcode readers are also called UPC (Universal Product Code) available on most products. Barcode readers consist of a handheld scanner and a base. The name of the company, manufacturing date, expiry date, etc. This information is provided to the computer for further processing. Such information is called system variables. Barcode readers are used in libraries, supermarkets, etc. A barcode reader is shown in Fig. 1.36.

Fig. 1.36 Barcode with Reader

iii. What are output devices? Explain its types.
Answer
Output Devices
Output devices are peripheral devices that transfer information from the computer are called output devices. Output devices convert information into human readable form. Output devices are also known as peripheral devices. Data from computer memory to the outside world. The display or end-user graphical is shown.
Types of Output Devices
The most common types of output device
- Monitor
- Printer
- Plotter
- Speaker

1. Monitors
Monitors, sometimes called a VDU (Visual display unit), is an electronic output device for computers. It displays the results of the user activities. The output produced by monitors is called

softcopy output.
Types of Monitors
The common types of monitors are as follows.
- CRT (Cathode Ray Tube)
- LCD (Liquid Crystal Display)
- LED (Light-Emitting Diodes)

Printers
Printers are used to produce hardcopy of output. In the past, printers were connected to the computer through parallel port but now they are connected through USB port.
Types of Printers
Printers vary in their capabilities based on the following characteristics
- The quality of output
- The speed at which they print
- The printing capacity

Main Categories of Printers
- Impact printers
- Non-impact printers

1. Impact Printers
Impact printers are those printers, which, work like typewriters. Impact printers use electromechanical mechanism which causes the character shapes to be pressed against the paper and leave an image of character on the paper.
2. Non-impact Printers
Non-impact printers produce a printed image without striking the paper. The printing quality and speed of these printers is better than impact printers are. These printers produce very little noise while printing.
3. Plotters
Plotters are those devices used to produce large-size hardcopy output. Plotters are used for a variety of applications, which include drawing graphs, making maps, plotting and engineering drawings/computer-aided designs/computing shop and architecture.
Types of plotters
Plotters are of two types, which are as follows
- Flatbed Plotter
- Drum Plotter
- Speaker

Speakers are audio output devices that are attached to the sound card on motherboard. Speakers produce enhance sound. The size of sound. Speakers are available in different shapes and sizes as shown in Fig. 1.37.

Fig. 1.37 Speakers

iv. Why plotters are used? Briefly explain their types.
Answer
Plotters
Plotters are used for a variety of applications, which include drawing graphs, making maps, plotting and engineering drawings/computer-aided designs and producing large-size architectural.
Types of plotters
There are two types of plotters which are as follows
- Flatbed Plotter
- Drum Plotter

1. Flatbed Plotter
Flatbed plotter plots on paper that is spread and fixed over a rectangular flatbed as shown in Fig 1.38.

Fig. 1.38 Flatbed plotter

Pens of different colours are mounted in the pen holding mechanism that moves on the surface to draw the image.
2. Drum Plotter
In drum plotter, paper/sheet is fed from one side and drum of the plotter rotates to move its paper to the other side. These plotters are used to print large size of paper/sheets as shown in Fig. 1.39.

Fig. 1.39 Drum Plotter

v. What is non-impact printer? Describe its types.
Answer
Non-impact Printers
Non-impact printers produce a printed image without striking the paper. The printing quality and speed of these printers is better than impact printers are. These printers produce very little noise while printing.
Types of Non-impact Printers
Commonly used non-impact printers are inkjet and laser printers.
1. Inkjet Printers
Inkjet printers are cheaper printers. They form printed images by spraying small drops of ink onto the paper. Inkjet printers are of regular quality and are slow. They are ideal for home use where they are used occasionally and where their low printers. An inkjet printer is shown in Fig. 1.40.

Fig. 1.40 Inkjet Printer

2. Laser printers
Laser printers are page printers, meaning that they print an entire page at a time. Their printing speed is measured in pages per minute (ppm). Laser printers are more expensive than inkjet printers. The laser printer is very high and they can print graphics in monochrome. A laser printer is shown in Fig. 1.41.

Fig. 1.41 Laser Printer

LAB ACTIVITIES

Following lab activities are to be carried out during the practical periods.

i) The assembling and disassembling of the computer system should be demonstrated to the students (Practically or through video demonstration)
Answer
Practical Work
ii) Students should be shown microprocessor, motherboard and power supply unit and the functions of these should be explained through video/animation.
Answer
Practical Work
iii) Different input/output devices covered in this unit should be shown to the students and their operation should be demonstrated.
Answer
Practical Work
iv) The concept of "Plug n Play" devices should be demonstrated/explained practically by attaching such devices.
Answer
Practical Work
v) Installation of various printers and plotters should be shown to the students for comparing print quality.
Answer
Practical Work
vi) Students may be taken to the places/organizations where hyper, mainframe and Mini computers are used.
Answer
Practical Work

Objective

Q1: Select the correct choice from the following questions.

1. There are two parts to all computer systems:
   A. System unit and CPU B. Hardware and Software
   C. Software and Communication devices D. input/output devices
2. It is the main component of a computer that interprets and executes instructions:
   A. CPU B. System Unit C. Hardware D. Software
3. The operation in which data is accepted from devices is called:
   A. Storage operation B. Output operation
   C. Processing operation D. Input operation
4. The operation in which arithmetic and logical operations are performed is called:
   A. Storage operation B. Output operation
   C. Processing operation D. Input operation
5. The operation in which result is sent to device is called:
   A. Storage operation B. Output operation
   C. Processing operation D. Input operation
6. The operation in which data is written on a device is called:
   A. Storage operation B. Output operation
   C. Processing operation D. Input operation
7. They are used to process complex calculations as well as designing and controlling of complicated machines, such as rockets and fighter planes:
   A. Supercomputers B. Mainframe computers
   C. Minicomputers D. Microcomputers
8. These computers are used in large corporations, banks, universities and scientific laboratories:
   A. Supercomputers B. Mainframe computers
   C. Minicomputers D. Microcomputers
9. IBM's Enterprise EC12, EC 196 and HP 16500 Series are examples of:
   A. Supercomputers B. Mainframe computers
   C. Minicomputers D. Microcomputers
10. These are widely used in industrial process control, scientific research and small business applications:
    A. Supercomputers B. Mainframe computers
    C. Minicomputers D. Microcomputers
11. IBM System/36 and HP 3000 are examples of:
    A. Supercomputers B. Mainframe computers
    C. Minicomputers D. Microcomputers
12. Its small size is a result of LSI (Large Scale Integration) and VLSI (Very large Scale Integration) technologies:
    A. Supercomputers B. Mainframe computers
    C. Minicomputers D. Microcomputers
13. These are used at home for personal use as well as for business applications:
    A. Supercomputers B. Mainframe computers
    C. Minicomputers D. Microcomputers
14. IBM Thinkpad, Toshiba Satellite series, Dell XPS, HP Envy series and Apple series are examples of:
    A. Supercomputers B. Mainframe computers
    C. Minicomputers D. Microcomputers
15. The first electro-mechanical computer was developed in:
    A. 1919 B. 1909 C. 1949 D. 1939
16. It is the interconnection between computer network and physical devices to collect and exchange data:
    A. Cloud computing B. Computing devices
    C. Data center D. IoT

17. It means instead of buying and installing your own computer system and software at your workplace:
    A. Cloud computing B. Computing devices
    C. Data center D. IoT
18. It is a way of outsourcing your computing requirements:
    A. Cloud computing B. Computing devices
    C. Data center D. IoT
19. It is a centralized location for collecting, storing, processing and distribution of vast amount of data;
    A. Cloud computing B. Computing devices
    C. Data center D. IoT
20. It consists of servers, routers, switches and backup equipment:
    A. Cloud computing B. Computing devices
    C. Data center D. IoT
21. It is what you can physically touch and see:
    A. Freeware B. Hardware C. Firmware D. Software
22. All tangible parts of computer system are referred as:
    A. Freeware B. Hardware C. Firmware D. Software
23. Monitor is a kind of:
    A. Freeware B. Hardware C. Firmware D. Software
24. Keyboard is a kind of:
    A. Freeware B. Hardware C. Firmware D. Software
25. Printer is a kind of:
    A. Freeware B. Hardware C. Firmware D. Software
26. It is any set of instructions, which are given to the computer to perform any task or to do any activity:
    A. Freeware B. Hardware C. Firmware D. Software
27. It tells the computer what to do and how to do:
    A. Freeware B. Hardware C. Firmware D. Software
28. It is a collection of system programs that control and coordinate the activities of a computer system:
    A. System software B. Application software C. Shareware D. Freeware
29. It consists of a collection of operative programs required to control computer hardware and also to execute application software:
    A. System software B. Licensed software C. Shareware D. Freeware
30. Operating system is a kind or example of:
    A. System software B. Application software C. Shareware D. Freeware
31. Device driver is a kind or example of:
    A. System software B. Application software C. Shareware D. Freeware
32. Utility software is a kind or example of:
    A. System software B. Application software C. Shareware D. Freeware
33. Language Processor is a kind or example of:
    A. System software B. Application software C. Shareware D. Freeware
34. It manages the hardware and software resources of a computer system:
    A. Device driver B. Operating system C. Utility software D. Language translator
35. These are system software that control the operation of hardware devices:
    A. Device driver B. Operating system C. Utility software D. Language translator
36. These are used to translate computer programs into machine language.
    A. Device driver B. Operating system
    C. Utility software D. Language processor
37. It is software that translates assembly language program into machine language:
    A. Assembler B. Compiler C. Interpreter D. Convertor

38. It is a set of programs designed to perform a specific task:
    A. System software B. Application software C. Shareware D. Freeware
39. This software is used to improve the way people do their work:
    A. Productivity software B. Business software
    C. Entertainment software D. Educational software
40. This software helps in efficiently running business functions of a company:
    A. Productivity software B. Business software
    C. Entertainment software D. Educational software
41. This software is used to entertain people. It includes games, audio video player, etc..
    A. Productivity software B. Business software
    C. Entertainment software D. Educational software
42. This software is used for learning purpose.
    A. Productivity software B. Business software
    C. Entertainment software D. Educational software
43. The computer software that is available in the form of source code that allows users to study, change and improve it:
    A. Open source software B. Licensed Software
    C. Productivity software D. Business software
44. This is given to people free of charge for a limited time period:
    A. System software B. Application software C. Shareware D. Freeware
45. It is available for use, free of cost. It is usually full version of the software for an unlimited period:
    A. System software B. Application software C. Shareware D. Freeware
46. It is an intermediate form between hardware and software;
    A. Freeware B. Shareware C. Firmware D. Firewalls
47. It refers to preventive measures against threads that can harm the internet applications:
    A. Cloud computing B. Computing devices
    C. Internet application security D. IoT
48. These devices consist of devices that accept data and convert it into machine-readable form:
    A. Input devices B. Output devices
    C. Communication devices D. Storage devices
49. These devices are often referred to as peripherals because they are physically separated from the system unit:
    A. Input devices B. Output devices
    C. Communication devices D. Storage devices
50. Keyboard is a kind of:
    A. Input devices B. Output devices
    C. Communication devices D. Storage devices
51. Mouse is a kind of:
    A. Input devices B. Output devices
    C. Communication devices D. Storage devices
52. Microphone is a kind of:
    A. Input devices B. Output devices
    C. Communication devices D. Storage devices
53. Scanner is a kind of:
    A. Input devices B. Output devices
    C. Communication devices D. Storage devices
54. Optical mouse is a kind of:
    A. Pointing devices B. Output devices
    C. Communication devices D. Storage devices
55. Trackball is a kind of:
    A. Pointing devices B. Output devices
    C. Communication devices D. Storage devices

56. Touch screen is a kind of:
    A. Pointing devices B. Output devices
    C. Communication devices D. Storage devices
57. Light pen is a kind of:
    A. Pointing devices B. Output devices
    C. Communication devices D. Storage devices
58. Touchpad is a kind of:
    A. Pointing devices B. Output devices
    C. Communication devices D. Storage devices
59. The First Computer Mouse was invented by:
    A. Blaise Pascal B. Charles Babbage C. John Napier D. Doug Engelbart
60. It is an input as well as output device:
    A. Trackball B. Touch screen C. Joystick D. Scanner
61. To scan an image, it is dragged over the image to be scanned:
    A. Hand-Held Scanner B. Flatbed Scanner C. Barcode reader D. Sheet-fed scanner
62. In this scanner, the image to be scanned is placed face down on the glass and a cover is lowered over it to exclude light:
    A. Hand-Held Scanner B. Flatbed Scanner C. Barcode reader D. Sheet-fed scanner
63. The output generated on paper by an output device such as printer or plotter is called:
    A. Neatcopy B. Roughcopy C. Hardcopy D. Softcopy
64. These devices transfer information from computer memory to the outside world:
    A. Storage devices B. Output devices
    C. Processing devices D. Input devices
65. The output in the form of data or information stored on a storage device or displayed on a monitor is called:
    A. Neatcopy B. Roughcopy C. Hardcopy D. Softcopy
66. Standard size of monitor is from:
    A. 15 to 22 inches B. 17 to 22 inches C. 19 to 22 inches D. 10 to 22 inches
67. CRT stands for:
    A. Crystal Ray Tube B. Carbon Ray Tube
    C. Common Reflection Tube D. Cathode Ray Tube
68. LCD stands for:
    A. Light Carbon Display B. Low Crystal Display
    C. Least Carbon Display D. Liquid Crystal Display
69. LED stands for:
    A. Light Emitting Diode B. Light Emitting Display
    C. Least Emitting Display D. Liquid Emitting Display
70. These are used to produce hardcopy of output:
    A. Printer B. Scanner C. Touch screen D. Digital camera
71. These are output device used to produce large size hardcopy output:
    A. Printer B. Plotter C. Touch screen D. Digital camera
72. These printers have 9 or 24 pins arranged in a matrix to print shapes of characters:
    A. Dot matrix printers B. Laser printers C. Chain printers D. Inkjet printers
73. These printers move rapidly by two geared pulleys while printing:
    A. Dot matrix printers B. Laser printers C. Chain printers D. Inkjet printers
74. These printers print characters and all kinds of images by spraying small drops of ink on the paper:
    A. Dot matrix printers B. Laser printers C. Chain printers D. Inkjet printers
75. These printers are page printers, meaning that they print an entire page at a time:
    A. Dot matrix printers B. Laser printers C. Chain printers D. Inkjet printers

Answers:

1.	Hardware and Software	2.	CPU
3.	Input operation	4.	Processing operation

6.	Output operation	6.	Storage operation
7.	Supercomputers	8.	Mainframe computers
9.	Mainframe computers	10.	Minicomputers
11.	Minicomputers	12.	Microcomputers
13.	Microcomputers	14.	Microcomputers
15.	1939	16.	IoT
17.	Cloud computing	18.	Cloud computing
19.	Data center	20.	Data center
21.	Hardware	22.	Hardware
23.	Hardware	24.	Hardware
25.	Hardware	26.	Software
27.	Software	28.	System software
29.	System software	30.	System software
31.	System software	32.	System software
33.	System software	34.	Operating system
35.	Device driver	36.	Language processor
37.	Assembler	38.	Application software
39.	Productivity software	40.	Business software
41.	Entertainment software	42.	Educational software
43.	Open source software	44.	Shareware
45.	Freeware	46.	Firmware
47.	Internet application security	48.	Input devices
49.	Input devices	50.	Input devices
51.	Input devices	52.	Input devices
53.	Input devices	54.	Pointing devices
55.	Pointing devices	56.	Pointing devices
57.	Pointing devices	58.	Pointing devices
59.	Doug Engelbart	60.	Touch screen
61.	Hand-Held Scanner	62.	Flatbed Scanner
63.	Hard Copy	64.	Output devices
65.	Softcopy	66.	15 to 22 inches
67.	Cathode Ray Tube	68.	Liquid Crystal Display
69.	Light Emitting Diode	70.	Printer
71.	Plotter	72.	Dot matrix printers
73.	Chain printers	74.	Inkjet printers
75.	Laser printers		

Q2: Give short answers of the following questions.

Q1: Define computer.
Ans. A computer is an electronic device that accepts data (as Input), performs operations (as Processing) on data at very high speed and produces the results (as Output). It is a programmable machine that executes a programmed list of instructions that it is provided.

Q2: Define digital computer.
Ans. A digital computer is a machine that can solve problems for people by carrying out instructions given to it

Q3: Give some examples of computing devices.
Ans. Following are some computing devices:

- ATM machine
- Digital alarm clock
- Digital washing machine
- Microwave oven

5.	Output operation	6.	Storage operation
7.	Supercomputers	8.	Mainframe computers
9.	Mainframe computers	10.	Minicomputers
11.	Minicomputers	12.	Microcomputers
13.	Microcomputers	14.	Microcomputers
15.	1939	16.	IoT
17.	Cloud computing	18.	Cloud computing
19.	Data center	20.	Data center
21.	Hardware	22.	Hardware
23.	Hardware	24.	Hardware
25.	Hardware	26.	Software
27.	Software	28.	System software
29.	System software	30.	System software
31.	System software	32.	System software
33.	System software	34.	Operating system
35.	Device driver	36.	Language processor
37.	Assembler	38.	Application software
39.	Productivity software	40.	Business software
41.	Entertainment software	42.	Educational software
43.	Open source software	44.	Shareware
45.	Freeware	46.	Firmware
47.	Internet application security	48.	Input devices
49.	Input devices	50.	Input devices
51.	Input devices	52.	Input devices
53.	Input devices	54.	Pointing devices
55.	Pointing devices	56.	Pointing devices
57.	Pointing devices	58.	Pointing devices
59.	Doug Engelbart	60.	Touch screen
61.	Hand-Held Scanner	62.	Flatbed Scanner
63.	Hard Copy	64.	Output devices
65.	Softcopy	66.	15 to 22 inches
67.	Cathode Ray Tube	68.	Liquid Crystal Display
69.	Light Emitting Diode	70.	Printer
71.	Plotter	72.	Dot matrix printers
73.	Chain printers	74.	Inkjet printers
76.	Laser printers		

Q.2: Give short answers of the following questions

Q1: Define computer.
Ans. A computer is an electronic device that accepts data (as Input), performs operations (as Processing) on data at very high speed and produces the results (as Output). It is a programmable machine that executes a programmed list of instructions that it is provided.

Q2: Define digital computer.
Ans. A digital computer is a machine that can solve problems for people by carrying out instructions given to it.

Q3: Give some examples of computing devices.
Ans. Following are some computing devices:

- ATM machine
- Digital alarm clock
- Digital washing machine
- Microwave oven

- Toys
- Cell phones
- CD player

Q4: Give some examples of computing devices.
Ans.

1. The computer of ATM machine gives banking transactions facilities.
2. The computer of digital alarm clock sets the time for alarm and manages calendar.
3. The computer of digital washing machine can be programmed to wash clothes.

Q5: Briefly describe the purpose of a computer system.
Ans. The purpose of a computer system is to accept data, process it and as a result of processing, produce output in the form of useful information. The input unit of computer presents data to the processor for processing. The results of processing of the data are displayed on the monitor screen, printed on paper or sent to any other output or storage device.

Q6: Describe the factors on which we can classify the computers.
Ans. There are several factors that make computers different from each other. These factors are physical size, cost, speed, etc. Based on these factors, computers are classified into four categories.

1) Supercomputers
2) Mainframe computers
3) Minicomputers
4) Microcomputers

Q7: Give some uses of supercomputers.
Ans.

1. Supercomputers are also used in nuclear research and weather forecasting, which requires huge amount of calculations to be performed at high speed.
2. In Pakistan, supercomputers are used in many organizations, like Atomic Energy Research Centre.

Q8: Give some uses and examples of mainframe computers.
Ans. Uses: Mainframe computers are used in large corporations, banks, universities and scientific laboratories.
Examples: Some examples of mainframe are IBM's Enterprize EC12, EC 196 and HP 16500 Series.

Q9: Give some uses and examples of minicomputers.
Ans. Uses: Minicomputers are widely used in industrial process control, scientific research and small business applications.
Examples: Examples of minicomputer are IBM System/36 and HP 3000.

Q10: Give some uses and examples of microcomputers.
Ans. Uses: Microcomputers are used at home for personal use as well as for business applications. A large variety of software is available for use on microcomputers.
Examples: Some examples of microcomputer are IBM Thinkpad, Toshiba Satellite series, Dell XPS, HP Envy series and Apple series.

Q11: Name some popular mobile computing devices.
Ans. Following are popular mobile computing devices:

- Tablet PCs
- PDAs (Personal Digital Assistants)
- Smart phones

Q12: Which smart devices are used in IoT?
Ans. All kinds of household items can be modified to work in an Internet of Things system. These device are known as smart devices and they are designed in such a way that they can interact with human beings through wireless connection.

Q13: Describe advantages of cloud computing.
Ans. The advantage of cloud computing is that you do not have to buy and maintain a complex computer system. This cuts cost of buying computers and peripherals. Besides, you are not worried about equipment going out of date and other problems related with-system security and reliability.

Q14: Describe disadvantages of cloud computing.
Ans. The disadvantage of cloud computing is that it requires a reliable high speed broadband connection functioning the whoffiTime you are working. Another disadvantage of cloud computing is the privacy and security risk of having valuable data on someone else's system in an unknown location.

Q15: Define data centers.
Ans. Data center is a centralized location for collecting, storing, processing and distribution of vast amount of data.

Q16: State the use of data center.
Ans. Organizations such as government agencies, banks, educational institution, telecommunication companies and social networking services use large amount of data and thus have requirement for data center. Many companies are moving their data centers to cloud services to cut the cost of running their own computing networks and servers.

Q17: Give some examples of computer hardware.
Ans. All physical components of computer system, such as monitor, keyboard, hard disk, printer, along with the circuitry connecting them are known as computer hardware.

Q18: What is the need of software?
Ans. A computer cannot do anything on its own. It must be instructed to do a desired job. Hence, it is necessary to specify a sequence of instructions, which a computer must perform to solve a problem.

Q19: Give some examples of software.
Ans. Word-processing software, spreadsheet software and database management software may contain many programs for creating, editing, formatting and printing different types of documents.

Q20: Name the types of computer software.
Ans. Computer software can be classified into the following types:

- System Software
- Application Software
- Internet Applications
- Licensed Software, Open Source Software, Shareware and Freeware

Q21: What is the purpose of system software?
Ans. The purpose of system software is to make the use of computer more effective and efficient. A computer without some kind of system software would be ineffective and impossible to operate.

Q22: Give some examples of system software.
Ans. Some examples of system software are:

- Operating system
- Device Drivers
- Utility Software
- Language Processors/Translators

Q23: Name some commonly used operating system.
Ans. Some commonly used operating systems are Windows, Linux, Mac OS and Android.

Q24: Which tasks are performed by operating system?
Ans. Operating system performs the following tasks.

- Allocates system resources
- Manages files by maintaining a proper file and folder system
- Loads and executes application software
- Controls the operation of all the input/output devices
- Maintains security

- Controls network operations
- Provides user interface

Q25: What is meant by Plug n Play Devices?
Ans. Some devices like Mouse, Keyboard, Monitor, USB Flash drive, etc. are "Plug n Play" devices. Their software is preinstalled with Windows. When attached, the computer system automatically recognizes them.

Q26: Name few important utilities of windows.
Ans. A few important utilities are disk defragmenter, disk cleaner, file compression utilities, antivirus utility, file manager, network utilities and utilities to configure hardware devices.

Q27: Define assembler.
Ans. Assembler is software that translates assembly language program into machine language.

Q28: Define compiler.
Ans. Compiler is software that translates a program written in a high-level language into machine language. It converts the entire program into machine language before execution by the computer.

Q29: Define interpreter.
Ans. Interpreter is software that translates high-level language into machine language but it translates one instruction at a time and executes it immediately before the translation of the next instruction.

Q30: Give some examples of application software.
Ans. Some examples of application software are:

- Productivity Software
- Business Software
- Entertainment Software
- Educational Software

Q31: What are the important internet applications?
Ans. Following are the important internet applications:

- Web Applications
- Cloud Computing Applications
- Social Media Network Applications

Q32: What is meant by web application?
Ans. A web application is a program that runs on a remote server while its users interact with it through a Web browser.

Q33: What is meant by copyright law?
Ans. The software license deals with the Copyright Law. Copyright law prevents illegal copying of computer software. It allows creators of computer software to benefit financially from their software and to retain some control over how it is used.

Q34: Name some examples of freeware.
Ans. Some examples of freeware are:

- Skype
- Viber
- Mozilla Web browser

Q35: Name some parts of Internet application security system.
Ans. Internet application security system consists of following programs:

- Firewalls
- Anti-Virus Programs
- Spyware Detection
- Removal Programs
- Encryption/Decryption Programs

Q36: Name some input devices.
Ans. Some input devices are as follows:

- Keyboard

- Mouse
- Joystick
- Microphone
- Image Scanners

Q37: Name some commonly used pointing devices.
Ans. Commonly used pointing devices are as follows:

- Mouse
- Trackball
- Joystick
- Touch Screen
- Light Pen
- Touch Pad

Q38: Write down the uses of scanners.
Ans. Nowadays, scanners are widely used to get drawings, diagrams and photographs into computer systems for incorporation into documents and books which are made up electronically prior to printing.

Q39: Name the different types of scanners.
Ans. There are different types of scanners like:

- Hand-Held Scanner
- Flatbed Scanner
- Barcode Reader

Q40: What are the uses of hand-held scanners?
Ans. Hand-held scanners are very useful for scanning articles from magazine, newspapers and books.

Q41: What is meant by hardcopy?
Ans. The output generated on paper by an output device such as printer or plotter is called Hardcopy output.

Q42: What is meant by softcopy?
Ans. The output in the form of data or information stored on a storage device or displayed on a monitor is called Softcopy output.

Q43: Name common types of monitors.
Ans. The common types of monitors are as follows:

- CRT (Cathode Ray Tube)
- LCD (Liquid Crystal Display)
- LED (Light Emitting Diodes)

Q44: Write down few characteristics of printers.
Ans. Printers vary in their capabilities based on the following characteristics.

- The quality of output
- The ability to print graphics
- The printing speed

Q45: What are the main categories of printers?
Ans. There are two main categories of printers.

- Impact printers
- Non-impact printers

Q46: How many types of plotters are there?
Ans. Plotters are of two types, which are as follows:

- Flatbed Plotter
- Drum Plotter

Q47: Describe the use of speakers
Ans. Speakers are audio output devices that are attached to the sound card on motherboard. Speakers produce softcopy output in the form of voice.
